INVITATION

The Delray Beach Community Redevelopment Agency (CRA) hereby requests proposals from interested qualified Not-for-Profit parties specializing in affordable / work force housing for the development and disposition of ten (10) residential properties owned by the CRA, within the Southwest Neighborhood of the CRA District of the City of Delray Beach, Florida, more specifically described in Section C of this Request for Proposals (RFP). It is the CRA's intention to dispose of said properties to a qualified not-for-profit entity, for the purpose of providing affordable/workforce housing, and to enter into an agreement with the successful proposer in order to provide for-sale single family housing that is restricted on a long-term basis for affordable/workforce housing. It is the CRA's intent that the properties are developed concurrently base on plans prepared by the CRA.

The CRA is vested by the State of Florida pursuant to its powers under Florida Statutes, Chapter 163, Part III, the Community Redevelopment Act of 1969 as amended, with the authority to request proposals for the redevelopment of any area within its district in order to effectuate redevelopment pursuant to the goals and objectives of the CRA Redevelopment Plan.

Factors that the CRA will use in judging the proposals include, but are not limited to, the Proposer's experience in the provision and construction of affordable housing and income qualification of home buyers, the pricing structure, and development fees. Selection criteria are discussed in more detail within this RFP.

Upon receipt of an acceptable proposal and a negotiated contract with a Successful Proposer, as well as the applicant's compliance with conditions precedent to closing, the CRA will close on the properties as described in the RFP, or as agreed to pursuant to the contract negotiated between the Successful Proposer and the CRA.

Proposers are required to submit one (1) unbound original and eight (8) copies, and an electronic PDF file of the full response, sealed and marked on the outside of the package "Request For Proposals No. CRA 2019-03, Development & Disposition of CRA-Owned Properties in the SW Neighborhood for Workforce Housing", delivered to the CRA office located at 20 North Swinton Avenue, Delray Beach, FL 33444 **on or before 2:00 pm on Thursday, May 23, 2019**.

PROPERTY INFORMATION

The subject properties are located within the Southwest Neighborhood of the CRA District (Sub Area #8), specifically the west side of SW 7th Avenue, between SW 3rd and 4th Streets, and 238 SW 6th Avenue.

The majority of the properties are approximately 50' X 130'.

The City of Delray Beach is in the design phase of a Streetscape & Utility Improvement Project in the Southwest Neighborhood (SW 3rd Court, SW 4th Street, SW 6th Street, and SW 7th Avenue), which includes improvements to utilities (water, sewer, drainage, lighting), alleys, sidewalks, installation of streetlights, and expansion of the City's Reclaimed Water System. Sidewalks and parallel parking spaces will also be installed adjacent to the CRA-owned properties along SW 7th Avenue and SW 4th street as part of the streetscape and utility project.

Subject: Report of Geotechnical Exploration
Proposed Residential Development
10 Single-Family Residences
NW Corner of SW 4th Street and SW 7th Avenue
Delray Beach, Florida

Dear Mr. Costello:

Nutting Engineers of Florida, Inc. (NE), has performed a Geotechnical Exploration for the proposed residential development at the above referenced site in Delray Beach, Florida. This exploration was performed in accordance with the written authorization to proceed provided by Delray Beach CRA dated March 21, 2017. This evaluation was performed to develop information regarding subsurface soil conditions at specific test locations which along with proposed construction information provided was used to develop opinions regarding earthwork procedures and foundations for support of the proposed construction. This report presents our findings and recommendations based upon the information examined at the time of this evaluation.

PROJECT INFORMATION

We note that our office previously provided a Report of Preliminary Geotechnical Exploration for the possible development for Habitat for Humanity dated March 16, 2015. Since that time we understand that plans have been more finalized for the proposed construction.

The subject property for development consists of the adjoining lots located along the NW corner of SW 4th Street and SW 7th Avenue. We understand that plans include the clearing of the currently mostly vacant lots for the construction of approximately 10 new one-story single family residences at the site. Along with the residences an associated new asphalt paved roadway may also be constructed through the central portion of the block.

The properties are mostly cleared with low lying vegetation; however some more heavily vegetated areas do exist (extensive tree and vegetation growth). Plans for the new residences were not available at the time of our exploration; therefore the structures may consist of either wood frame and crawl space or concrete block construction. The proposed residences are planned to be supported upon a shallow foundation system.

Based on current site elevations, we estimate that one to two feet of fill may be required to bring the site up to construction grade; however, the final building pad elevation shall be determined by a professional architect, civil engineer, or other qualified party.

NE should be notified in writing by the client of any changes in the proposed construction along with a request to amend our foundation analysis and/or recommendations within this report as appropriate.

GENERAL SUBSURFACE CONDITIONS

Soil Survey Maps

As part of the geotechnical exploration, we have reviewed available Soil Conservation Service (SCS) survey maps for Palm Beach County. These SCS maps provide qualitative information about potential general shallow soil conditions in the project vicinity. This information was derived from approximately 6 ft. deep manual auger borings, aerial photo and surface feature interpretation at some point in the past (mid 1980's to early 1970's). The SCS data may or may not reflect actual current site conditions. A review of the Soil Survey for Palm Beach County revealed that at the time the survey was conducted, the soils at the site were described as Paola sand. The Paola series consists of nearly level to sloping, excessively drained, deep, sandy soils in long, narrow dune-like ridges near the Atlantic coast. In general the subsoils are white to yellowish sands that extend to a depth of approximately six feet or more. We note that the soil surveys were typically penetrated to a depth of approximately six feet.

Subsurface Exploration

NUTTING ENGINEERS OF FLORIDA, INC. performed 10 Standard Penetration Test (SPT) borings (ASTM D-1586) to depths of ten feet below land surface in the general area of the residences. The locations of the test borings are indicated on the Boring Location Plan presented in the Appendix of this report. The boring locations were identified in the field using approximate methods; namely, a measuring wheel and available surface controls. As such the soil boring locations should be considered to be approximate.

Test Boring Results

In general, the soil boring locations recorded some surficial topsoil or sand and limestone fragments in the upper two to eight inches, underlain by very loose to medium dense light gray sand to a depth of six feet. Below six feet loose to medium dense dark brown to brown sand was encountered to a depth of ten feet, the maximum depth explored. Please see the enclosed soil classification sheet in the Appendix of this report for additional important information regarding these descriptions, the field evaluation and other related information.

Note: Substantially different subsurface conditions may exist at other areas of the site. Buried debris may or may not be identified or adequately delineated by soil borings. Test pit excavation can provide more insight into such conditions and rock lithology if present. Such conditions may be revealed during site development activities (e.g. proof rolling, utility & foundation excavation activities) or other related activities. Should additional assurance be desired by the client, further subsurface investigation could be performed.

Groundwater Information

The immediate groundwater level is typically measured at the boring locations at the time of drilling. The groundwater level was not encountered up to the maximum boring depth of ten feet below the existing ground surface at the time of drilling.

The immediate depth to groundwater measurements presented in this report will not provide a reliable indication of stabilized or more long term depth to groundwater at this site. Water table elevations can vary dramatically with time through rainfall, droughts, storm events, flood control activities, nearby surface water bodies, tidal activity, pumping and many other factors. For these reasons, this immediate depth to water data **should not** be relied upon alone for project design considerations.

ANALYSIS AND RECOMMENDATIONS

The borings performed for this project suggest that the upper six feet of the soil profile is in a loose to very loose state. Based on this, in order to prepare the site for the proposed construction, an intense surficial compaction program will need to be implemented. Once the site is successfully prepared in accordance with the recommendations presented in this report, the site may be developed with the proposed residences using a shallow foundation system designed for an allowable soil bearing pressure of 2,000 pounds per square foot. Once plans are finalized for the proposed construction, a copy should be provided to Nutting Engineers for review to determine whether additional details or changes to our recommendations are warranted. All work should be completed in accordance with applicable building codes, other regulations as appropriate, and good standard local practice.

We recommend a minimum width of 16 inches for continuous footings and 24 inches for individual footings, even though the soil bearing pressure may not be fully developed in all cases. We recommend that the bottom of footings be at least 12 inches below the lowest adjacent finished grade.

It is our opinion that the floor slab system may be constructed as a slab on grade. We recommend that a vapor barrier be placed between the soil and concrete. We also recommend that the reinforcing steel mesh be placed at the approximate center of the slab for tensile support.

Settlement Analysis

We performed a settlement evaluation based upon a hypothetical improved soil profile following completion of the compaction using a moderately sized vibratory compactor for the construction. This method should improve the soils to provide an allowable bearing capacity of 2,000 pounds per square foot. It was estimated that upon proper completion, long-term total settlements should be on the order of less than approximately one inch. Differential settlements should be approximately one-half of the total settlement. Distortions that occur along wall footings should not be more than 1 in 500. Most of this settlement should occur upon the application of the dead load during construction.

In order to maintain the calculated settlement throughout the life of the structure it would be necessary to grade the site such that stormwater is directed away from the foundations. This could be maintained through the use of roof gutters and downspouts to migrate the water away from the residence and foundations. Any ponding nearby/adjacent to walls and foundations should be avoided.

Site Preparation – Individual Residence

The surficial organic soils, tree root mats, debris from the clearing operations, and any unsuitable soils as determined by the Geotechnical Engineer will need to be completely removed within the construction area (residence footprints) and to a lateral distance of at least 5 feet beyond each residence footprint limits. A Nutting Engineer's representative should be present to observe that the stripping operations are performed as we have discussed herein.

Upon approval by the geotechnical engineer, the stripped surface (no fill added at this time) within each residence footprint area should then be thoroughly soaked with water and compacted with at least 20 overlapping passes of a vibratory compactor having a minimum dynamic force of 10 tons operated no faster than at a slow walking pace. The roller coverage's should be equally divided into two perpendicular directions. The compaction operations must be observed by a representative of Nutting Engineers.

In addition, the surface should also be compacted until a density equivalent to at least 98 percent of the modified Proctor maximum dry density (ASTM D-1557) is achieved to a depth of at least 12 inches below the compacted surface.

Any structural fill needed to bring the site to construction grade may then be placed in lifts not exceeding twelve inches in loose thickness. Each lift should be thoroughly compacted until densities equivalent to at least 98 percent of the modified Proctor maximum dry density are uniformly obtained. Fill should consist of granular soil, with less than 10% passing the No. 200 sieve, free of rubble, organics (5% or less) clay, debris and other unsuitable material.

The fill should have ASTM designation (D-2487) of GP, GW, SP, or SW, with a maximum particle size of no more than 3 inches or as otherwise approved by Nutting Engineers.

Following site and building pad construction as discussed above, the foundation area should be excavated and the footings formed. The bottom of foundation excavations should be compacted after excavation to develop a minimum density requirement of 98 percent of the maximum modified Proctor dry density, for a minimum depth of two (2) feet below the bottom of the footing depth, as determined by field density compaction tests. The floor slab area should also be compacted in the same manner.

Pavement Areas, If Needed

Provided below are general pavement recommendations. The project Civil Engineer should review the information in order to provide final pavement design specifications.

Pavement areas should be compacted to a minimum of 98 percent of the modified Proctor maximum dry density to a depth of at least 12 inches below the subgrade level. We recommend that stabilized subgrade having a minimum Limerock Bearing Ratio (LBR) of 40 be placed to a depth of approximately one foot below the base course. The base course will range from approximately 6 to 8 inches, and should have a minimum LBR of 100. We can provide more detailed pavement design recommendations including material types and thicknesses. However, it would be necessary to provide us with the anticipated traffic loading characteristics and pavement design life.

At this time it appears that material will need to be imported in order to develop the subbase and base course sections at the site. We would require that the collection of bulk samples of both the imported base and subbase course in order to determine their LBR values and suitability. When more engineering information is available pertaining to the pavement design we should be notified.

LIMITATIONS OF LIABLILITY

WARRANTY

We warranty that the services performed by Nutting Engineers of Florida, Inc. are conducted in a manner consistent with that level of care and skill ordinarily exercised by members of the profession in our area currently practicing under similar conditions at the time our services were performed. ***No other warranties, expressed or implied, are made.*** While the services of Nutting Engineers of Florida, Inc. are a valuable and integral part of the design and construction teams, we do not warrant, guarantee or insure the quality, completeness, or satisfactory performance of designs, construction plans, specifications we have not prepared, nor the ultimate performance of building site materials or assembly/construction.

SUBSURFACE EXPLORATION

Subsurface exploration is normally accomplished by test borings; test pits are sometimes employed. The method of determining the boring location and the surface elevation at the boring is noted in the report. This information is represented in the soil boring logs and/or a drawing. The location and elevation of the borings should be considered accurate only to the degree inherent with the method used and may be approximate.

The soil boring log includes sampling information, description of the materials recovered, approximate depths of boundaries between soil and rock strata as encountered and immediate depth to water data. The log represents conditions recorded specifically at the location where and when the boring was made. Site conditions may vary through time as will subsurface conditions. The boundaries between different soil strata as encountered are indicated at specific depths; however, these depths are in fact approximate and dependent upon the frequency of sampling, nature and consistency of the respective strata. Substantial variation between soil borings may commonly exist in subsurface conditions. Water level readings are made at the time and under conditions stated on the boring logs. Water levels change with time, precipitation, canal level, local well drawdown and other factors. Water level data provided on soil boring logs shall not be relied upon for groundwater based design or construction considerations.

LABORATORY AND FIELD TESTS

Tests are performed in *general* accordance with specific ASTM Standards unless otherwise indicated. All criteria included in a given ASTM Standard are not always required and performed. Each test boring report indicates the measurements and data developed at each specific test location.

ANALYSIS AND RECOMMENDATIONS

The geotechnical report is prepared primarily to aid in the design of site work and structural foundations. Although the information in the report is expected to be sufficient for these purposes, it shall not be utilized to determine the cost of construction nor to stand alone as a construction specification. Contractors shall verify subsurface conditions as may be appropriate prior to undertaking subsurface work.

Report recommendations are based primarily on data from test borings made at the locations shown on the test boring reports. Soil variations commonly exist between boring locations. Such variations may not become evident until construction. Test pits sometimes provide valuable supplemental information that derived from soil borings. If variations are then noted, the geotechnical engineer shall be contacted in writing immediately so that field conditions can be examined and recommendations revised if necessary.

The geotechnical report states our understanding as to the location, dimensions and structural features proposed for the site. ***Any significant changes of the site improvements or site conditions must be communicated in writing to the geotechnical engineer immediately*** so that the geotechnical analysis, conclusions, and recommendations can be reviewed and appropriately adjusted as necessary.

CONSTRUCTION OBSERVATION

Construction observation and testing is an important element of geotechnical services. The geotechnical engineer's field representative (G.E.F.R.) is the "owner's representative" observing the work of the contractor, performing tests and reporting data from such tests and observations. ***The geotechnical engineer's field representative does not direct the contractor's construction means, methods, operations or personnel.*** The G.E.F.R. does not interfere with the relationship between the owner and the contractor and, except as an observer, does not become a substitute owner on site. The G.E.F.R. is responsible for his/her safety, but has no responsibility for the safety of other personnel at the site. The G.E.F.R. is an important member of a team whose responsibility is to observe and test the work being done and report to the owner whether that work is being carried out in general conformance with the plans and specifications. The enclosed report may be relied upon solely by the named client.

REQUEST FOR PROPOSALS NO. CRA 2019-03
PURCHASE, DEVELOPMENT & DISPOSITION OF CRA-OWNED PROPERTIES IN THE SW NEIGHBORHOOD FOR WORKFORCE HOUSING

May 17, 2019

TO ALL PROPOSERS AND OTHERS CONCERNED

The Delray Beach Community Redevelopment Agency ("CRA") has heretofore published a Request for Proposals dated April 22, 2019, with respect to its intent to receive and consider Requests for Proposal (RFP) by qualified Not-for-Profit parties specializing in affordable / work force housing for the development and disposition of ten (10) residential properties owned by the CRA, within the Southwest Neighborhood of the CRA District of the City of Delray Beach. The intent of this Addendum is to address questions, errors, and clarify other aspects of the RFP. Proposers submitting proposals for the above-referenced project shall take note of the following changes, additions, deletions clarifications, etc., to the RFP which shall become a part of and have precedence over anything shown or described otherwise.

---

2. **See Updated Exhibit B – Corey Isle Bid Form. The first Tab shall be used for the Base Bid, the second Tab shall be used to account for Bid Alternates.**

---

3. **Which of the models is to build on the property located at 238 SW 6th Ave., in accordance to the Site Plan which shows Site #1 with model number A1 from the south end of SW 7th Ave.? (see page 4 of 24 and 15 of 24)**

   This lot can accommodate either unit type. Please include Model A as the base bid and include Model B as a Bid Alternate.

---

4. **Is there a Geotech report for 238 SW 6th Ave and if so can you provide a copy?**

   The geotechnical report is in progress for this property.

---

5. **The soils report states that the development program is for one-story buildings, and that soil is loose to very loose, and that an "intense surficial compaction program will need to be implemented." It also says that once plans are complete a copy should be sent to Nutting Engineers for review to "determine whether additional details or changes to their recommendations are warranted." Does the 2-story units require an amendment to the soils report, and have the plans been sent to Nutting as per the soils report?**

   Nutting Engineers is currently reviewing the plans. No issues are anticipated with the construction of the two-story homes.

---

6. **Are you going to provide a revised site plan that will reflect the change in the Amendment?**

   The site plan provided in the RFP and in the addendum is accurate as it relates to the SW 7th Ave. properties. Therefore, a revised site plan is not necessary.

---

7. **Since the lots will not be 100% buildable upon conveyance to respondent, how are change orders going to be handled?**

   The lots are buildable. See Addendum #1, Item 22 regarding site conditions.

---

8. **Are the individual single page floor plans for each model not available?**

   See updated design drawings "Model A Combined Set" and "Model B Combined Set", attachments A and B of this addendum.

---

9. **The driveways are normally concrete built; please confirm that you want asphalt.**

   The driveways will be 6" concrete slab, WWF reinforced, and with a broom finish.

---

10. **On the front porch elevations it's calling for concrete columns with a concrete beam. Can we VE this to a steel 4" column with 2x headers/ beam around? This is a standard detail used for years and saves money. We would wrap the columns in wood and apply stucco.**

    Please provide an Alternate Bid for the VE presented. Include trimming out column in hardi board and trim, not stucco. If VE items is selected, Architect will detail appropriately.

---

11. **On the two story plan we do not see any A/C returns in the bedrooms. These will be needed per code so please confirm if it was an oversight?**

    A/C returns are not required for all bedrooms.

---

12. **In the kitchen is that 3 headed light a track light, couldn't find a symbol to confirm?**

    This is shown in the Model B which is incorrect. Use the light concept in the Model A which is the recess lighting for bidding purposes.

---

13. **Can we VE the fascia and just use 2x6 primed spruce in lieu of 2x6 fascia and then adding 5/4x8" hardi preprimed? Not typical building practice. Please confirm.**

    Provide a Bid Alternate as proposed. Also, an alternate bid for a 2x4 structural sub fascia with a 5/4 x 6 finished fascia.

---

14. **Wall section calls for open truss tails and bead board. Typical standard for VE is lathe and stucco soffits, please confirm.**

    Provide a Bid Alternate as proposed.

---

15. **Normal roof sheathing is 19/32 plywood, is there a reason the plans are calling for a Zip System?**

    Provide a Bid Alternate as proposed. The Zip System dries the project in as the sheathing is applied. The 30# felt is eliminated and you have a better system to resist rainwater intrusion.

---

16. **Typically on block walls the standard is a 1x fir strip, plans are calling for 1-5/8 metal framing. Please confirm?**

    Provide a Bid Alternate as proposed. The space along with the R7 provides better insulation and reduces energy cost for the end user.

---

17. **Please confirm shingles are to be dimensional (not 3-tab) and section of metal roof on the B model is that 5V crimped or standing seam metal?**

    The selected roof materials are Architectural Dimensional Shingles and Standing Seam Metal. Color to be selected by CRA and Architect.

---

18. **Is there a reason you are calling for R38 foam and R7 foil? Standard is R20 foam and R4.1 foil.**

    Provide a Bid Alternate as proposed. The assembly shown provides several benefits including better insulation value, possible smaller AC size, and lower operating costs.
